

# One slip and we could all suffer

Many of us know someone who owes their life to an advanced surgical or medical technique. But it's not just a question of admiring those who help us get better, we should worship the ground they walk on - literally.

Flexible PVC - helps eliminate cross-infection by permitting wall and floor coverings to be joined without seams. In fact, tough, durable, non-slip PVC floor coverings and safe, hygienic wallcoverings are an essential contributor to health and safety everywhere from operating theatres to schools, nurseries and clinics. PVC is also inherently non-burning with very low flame spread characteristics.

It may not be surprising therefore that hospitals around the world have endorsed the use of PVC flooring. But the reasons they prefer PVC are also just as valid when it comes to reducing hazards in our homes and workplaces.

But what about the environment? Well, here comes the really good news. PVC is not just safe in manufacture and use,...even when it comes to disposing of PVC, you should have no fears. PVC recycling technology is well proven and the recovery of energy from PVC in modern incinerators offers an environmentally sound alternative.

So whatever operation you're involved in, PVC can help make sure you're treading on safe ground.

If you want to learn more about PVC in the environment, you're safer getting the facts from us first.

The Safe Choice...
